

# It's All About *Cellular Power*

It's About Giving Your Animals a Gift of Cellular Energy with Cellular Nutrition Super Food Products from AGNRG, Inc.

Each and every mammalian cell has from one to several thousand power generators (pictured below) called Mitochondria. The job of these cellular power plants is to convert carbohydrates and fats into energy packets called ATP.

Ordinarily, food has to be metabolized and actively transported into cells, from the blood stream, through cellular membranes and escorted into the mitochondria by insulin through its protective membranes/receptor sites. There, these food particles, namely the carbohydrates and fats, **are turned into ATP**. The packets of ATP then disperse throughout the cell to power the cell's numerous functions. In this mitochondrial energy creation process there is a **net gain of one ATP** molecule per carbohydrate or fat molecule. The truth is, however, that up to 36 ATP packets could be netted... if you didn't need to actively transport the fuel source past the various cellular membranes.

## Introducing Super Food

Cellular Nutrition's (CN) alpha polysaccharide peptide nutritional product accomplishes exactly that. There is a **net gain of 36 ATP** energy packet molecules. That's 36 times more power... and the cell **can now accomplish much more** than normally is possible—in terms of cellular healing, cellular waste removal (getting toxins out of the cell) and in support of overall performance.

That's why CN has **become very popular in New Zealand and Australia among horse trainers, breeders and owners of racing horses**. The difference that CN makes in recovering from **injuries, avoiding down-time and pure performance** is converting one animal expert after another into CN users.

Here's a statement from Jane Bennett, from *Equine Advantage*, Te Aroha, New Zealand, "Every horse that comes to me is given **Equine CN** as part of their feeding routine. I am blown away at the across the

board benefits and relief this product is providing with, **Arthritis, suspensory issues, coat, skin, joint, lameness, tying up, mental acuity, focus** and just obvious health shown by how happy they are."

Here's an endorsement from Shirley Newcomb, Midland, Texas, USA, a sought-after animal therapist, "Equine CN **changes hair, coat, the way they feel and overall health**. I have been using and recommending the Equine CN formula for two years. In my twenty years as an equine therapist I have **not seen a product work so fast and so well** as Equine CN."

## Alpha-Polysaccharide-Peptides - Key to Energy

CN's products, **Equine CN, Canine CN and Feline CN** are really only one product, labeled and packaged in different sizes—that product is Alpha Polysaccharide Peptides. CN comes as a white powder. It is the end result of a very specialized, mechanical processing of specific strains of rice.

This processing extracts the core nutrients of the germ of the rice kernel and reduces the particle size through nanotechnology to alpha size. In alpha-form, the protein bonded sugars are the right size and the right profile to be admitted freely into the cellular mitochondria, where they directly participate in energy production without energy loss from active transport nor production of free radical byproducts.

CN originates in the rice fields of Thailand's Siam Valley. The rice here is nutrient dense and uncontaminated by chemical fertilizers. It is mechanically hydrolyzed by a proprietary, multi-million dollar machine specifically built to convert beta-sized glyconutrients into alpha sized ones. The technology for doing this is a carefully guarded secret.

## Dosing

Dosages of CN for animals are size and health dependent. A normally healthy cat, for instance, would take a couple of grams per day only, while an injured horse should take up to 30 grams per day.

## Testimonials

---

**Dale Opie, Te Aroha, New Zealand, Vicky** — four year old thoroughbred, was constantly tying up. Because we could not feed her normally she had immature muscle development. After 3 weeks of feeding her Equine CN the change was obvious. She was being fed the same rigid diet but she must have been absorbing more from the food because her muscles improved and she looked great and did not tie up once.

We have since had her in training and she competed in a race without any problems. After seeing the impact on Vicky we now have other horses and ourselves on the product.

**Lyn Pinosa, Traditional Chinese Medicine Practitioner, Sydney, Australia** — I am treating two horses with Navicular Syndrome, both horses have only been on Equine CN for a few weeks but both have responded with freer movement, looking better and obviously happier. I strongly recommend these products to my animal clients.

**Diana Stewart, Midland, Texas, USA** — I purchased Easy Moons — in August 2006; he is now 15 years old. I have known him since he was 7 years old and at that age he developed a cyst in his nostril. We had the vet check him when we purchased him and the cyst was so large you could barely fit a finger in his nostril. The vet said there was nothing he could do barring major surgery and just to live with it, even though there was obvious discomfort. Within two weeks of putting him on the Equine CN formula the cyst started to shrink. After four weeks of the Equine CN formula being added to his feed the cyst was completely gone. This truly is a remarkable product.

**Jane Bennett, Equine Advantage, Te Aroha, New Zealand** — one of my client's horses — was prone to grass staggers and toxic build up. She started him on Equine CN and he was doing fine. Her other horse showed signs of toxic issues and she decided to give him a toxic binder and to be safe take the first one off CN and give him the binder in his feed too. The horse that had been eating Equine CN refused to eat the feed with the binder in it even to the point of kicking over the bucket

and refused to eat until Equine CN was put back in his feed!!

From my years of experience working with horses I have learned that they are smarter than we are when it comes to what should be eaten and what our body's need. When a horse refuses to eat until Equine CN is sprinkled on its food, then we know this is a must have product to maintain our animal's health.

**Dr. M McDonald, Winneconne, Wisconsin, USA** — **Reload** — my 5 year old golden lab had hurt her left rear hip when she was two, last September she got caught in a swing door and aggravated the injury. I took her to an orthopedic vet who recommended tendon surgery at a cost of \$6,000. I decided to try her on Canine CN at my neighbor's recommendation. The change in 5 days was unbelievable. Reload went from not being able to put any weight on her left rear leg to running around like a puppy. She has now been taking the product for 8 months and I have never seen her look and act so healthy.

**Cathy — 11yr old Huntaway Agility Dog** — Retired because of hip dysplasia and arthritis which was causing so much pain he was lame and couldn't jump up onto the back of the ute. I purchased a small bag of Canine CN really for myself but sometimes I sprinkled some on his food if I remembered. He started to change in the second week so I thought I'd stop the glucosamine and do just Canine CN for a while. Besides the fact that he loves it, I can't believe the change in him. For a dog that had no energy and didn't want to play with the others - he is now driving me mad, presenting toys all the time or a ball to throw for him to fetch. He is not showing any lameness and can now jump up into the ute without me having to lift him.

**Kea — Wellington — Ninja our 16 year old** — was always healthy but one day noticed her throwing up a lot of clear liquid and urinating frequently. The vet told us her kidneys were failing and it would only be a matter of time unless we wanted to spend a lot of money with the vet and even then there were no guarantees that she would live. We started sprinkling CN on her dry food and within three days she seemed fine, we didn't really believe it could be the CN, how could something work that quickly? so we stopped giving it to her and two days later all symptoms returned. We started her back on CN and two days later all was normal again, Wow. Eighteen months later Ninja is doing great, in fact she is acting like a kitten again.
